

J2EE: e-Board Case Study

Company Overview

Evoke Technologies is client-centric and relationship-based company, with focus to provide cost effective software maintenance & support while our client's can focus on future needs. As a **SEICMM level 3** standards company, Evoke differs from other offshore outsourcing software firms because we maintain a focused approach to building the solutions you demand, using our highly successful implementation methodologies.

Why Evoke?

Strategic IT solutions to ensure complete transformation. Our beneficial and comprehensive approach will help enterprises attain enduring, satisfying results. Our role is not confined to playing mere advisors but we will serve you to initiate, implement and refine solutions. What is more, we will prove that the solutions suggested by us are most lucrative for your enterprise.

About The Customer

Customer is a leading services based company in the space of Corporate Governance. Corporates with their growing business and looking for a better collaboration with board members & directors require a tool having collaborative workspace with file cabinet/membership applications, browser based document import/storage function.

eBoard Room is a secure, online workspace used to electronically manage board book documents, meeting status, communications and private document storage. Authorized users can access the boardroom work areas and documents anytime, anywhere!

Challenges

- Mapping the Business needs to workflow between the matter, document and eBilling
- Centralized access to documents for authorized user
- Designing customizable reporting tool for users
- Managing the business process flow for invoice generation, billing and payments in the eBill module

Approach

- Developed a web-based solution allowing customers to access their matters, documents and submit invoices. In order to achieve a seamless workflow, developed relationships between a matter, its related documents and an invoice.
- For document storage and versioning, used EMC's Content Management.
- Developed web service for Documentum related actions using DFC and DQL.
- Developed a reporting engine allowing the customer to customize their reports between matter, document and invoice.
- Developed an e-billing module Comprise of a billing engine to upload / create invoices.
- Designed additional functionalities that would allow them to achieve the same in multiple formats such as text, XML. Provided a mechanism by embedding a link to their case document in e-mail their by accessing the document upon authentication
- Performance tests and Stress testing is done at higher than normal simulated loads. Load testing is performed and measured the response times for critical transactions or processes.
